Presentation of Indicators and Glossary*¹

Total births: A **birth** is defined as the start of life when a child emerges from the body of its mother. The **total number of births** includes both live births and stillbirths in a given year or period of time. A **live birth** is the birth of a child who showed any sign of life; the number of live births refers to the number of births excluding stillbirths. **Stillbirth** means foetal death, namely death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy. Death is indicated by the fact that after such separation from its mother the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. ([Eurostat Regulation](#))

Distribution of parity: is defined as the number of previous live or stillbirths (0, 1, 2, or 3+ births) of women delivering a live or stillbirth. ([Euro-Peristat Indicator Definitions, C9](#))

Distribution of mother's educational level: is the distribution of education level of women delivering live or stillborn babies, expressed as highest level of education of the mother. Data is collected using most detailed educational groupings in national systems and recoded by Euro-Peristat using the international standard classification of education (ISCED - UNESCO, 1997): Primary not complete or none, Primary complete, Lower secondary (up to 3 or 4 years), (Upper) secondary (up to 6 or 7 years), Post secondary non tertiary (6 months to 2 years), First stage of tertiary education (Bachelor), Second stage of tertiary education (Master, doctorate or more), Unknown educational level. ([Euro-Peristat Indicator Definitions, R9](#))

Percentage of women who smoked during pregnancy²: Is the number of women who smoke during the third trimester of pregnancy expressed as a proportion of all women delivering live or stillborn babies. When data are not available for the third trimester of pregnancy, data are requested for another time point during pregnancy. ([Euro-Peristat Indicator Definitions, R8](#))

Psychoprophylaxis: a method of preparing women for childbirth without anesthetic, by means of education, psychological and physical conditioning, and breathing exercises, also called Lamaz technique.

¹ All definitions and the glossary are from the sources below:

(1) EUROSTAT (<http://ec.europa.eu/eurostat/statistics-explained/index.php/Glossary:Birth>)
(2) COMMISSION REGULATION (EU) No 328/2011 – EUROSTAT (<http://eur-lex.europa.eu/legal-content/en/TXT/HTML/?uri=CELEX:32011R0328&rid=1>)
(3) EURO-PERISTAT (<http://www.europeristat.com/our-indicators/indicators-of-perinatal-health.html>)

² In this report, we present the number of women who smoke during the total duration of pregnancy expressed as a proportion of all women delivering live or stillborn babies.

Distribution of timing of first antenatal visit: distribution of timing of first antenatal visit regardless of provider by trimester of pregnancy for all women delivering live or stillborn babies. Trimesters are defined as follows (by completed weeks of gestation): 1st trimester = < 15 weeks, 2nd trimester = 15 – 27 weeks 3rd trimester = 28 weeks or more. ([Euro-Peristat Indicator Definitions, R14](#))

Mode of fertility treatment³: is the number of women delivering live or stillborn babies after the following fertility treatments divided by the total number of women delivering live or stillborn babies: Induction of Ovulation only, IntraUterine Insemination (IUI) with or without OI, InVitro Fertilisation (IVF), IntraCytoplasmatic Sperm Injection (ICSI), InVitro Maturation (IVM); including frozen embryo transfers, Unknown treatment. ([Euro-Peristat Indicator Definitions, R13](#))

Mode of onset of labour: Is the number of deliveries associated with each of the following modes of labour onset, as a proportion of deliveries resulting in a live or stillbirth: Spontaneous onset, caesarean section prior to the onset of labour, labour induction (initiation of uterine contractions) by medical or surgical means prior to the onset of labour. ([Euro-Peristat Indicator Definitions, R15](#))

Mode of delivery: for a population of women and year: the number of births associated with each of the following modes: Vaginal non instrumental, Vaginal forceps, Vaginal ventouse, Vaginal (other, Thierry's spatula, etc..), Caesarean before or at onset of labour/elective, Caesarean during labour/emergency, as a proportion of all still and live births. ([Euro-Peristat Indicator Definitions, C10](#))

Gestational age: is the number of live births and fetal deaths at each completed week of gestation (starting from 22 weeks) expressed as a proportion of all live and stillbirths for singletons and multiples. Gestational age is defined as the best obstetrical estimate. This distribution is presented, as follows: 22-36 weeks of gestation (preterm births), 37-41 weeks (term births), 41+ weeks (post-term births). Preterm births can also be presented as: 22-27 weeks (extremely preterm), 28-31 weeks (very preterm), 32-36 weeks (moderately preterm). ([Euro-Peristat Indicator Definitions, C10](#))

Distribution of birth weight: is the number of births within each 500g weight interval expressed as a proportion of all live and stillbirths calculated by gestational age and vital status at birth for singletons and multiples. ([Euro-Peristat Indicator Definitions, C4](#))

Episiotomy: is the number of women who had an episiotomy expressed as a proportion of all women who had a vaginal delivery. Presented for all vaginal

³ In this report we present only the following categories: InVitro Fertilisation (IVF), IntraUterine Insemination (IUI), Ovulation Induction (IntraCytoplasmatic Sperm Injection (ICSI) and InVitro Maturation (IVM); including frozen embryo transfers are not presented).

deliveries and then for non-instrumental and instrumental separately. ([Euro-Peristat Indicator Definitions, R18](#))

Incidence of tears to the perineum: is the number of women who had a first-, second-, third-, or fourth-degree tear of the perineum expressed as a proportion of all women who had a vaginal delivery. Presented for all vaginal deliveries and then for non-instrumental and instrumental separately. Categories as follows (ICD10): 1st degree tear (ICD O70.0) involves the fourchette, perineal skin and vaginal membrane, 2nd degree tear (ICD O70.1) includes the skin and mucous membrane, and the fascia and muscles of the perineal body, 3rd degree tear (ICD O70.2) extends through skin, mucous membrane and perineal body and involves the muscle of the anal sphincter, 4th degree tear (ICD O70.3) extends through the rectal mucosa to expose the lumen of the rectum. . ([Euro-Peristat Indicator Definitions, R7](#))

Breast feeding during the first 48 hours after birth: is the number of babies who are partially breastfed (infant receives breast milk and the infant is allowed any food or liquid including non-human milk) and the number who are exclusively breastfed (infant receives breast milk and is allowed to receive drops and syrups) throughout the first 48 hrs of age as a proportion of all newborn babies. (Definitions from WHO Indicators for Assessing Breastfeeding Practices. Report from meeting 11-12 June 1991. Geneva, 1991.). ([Euro-Peristat Indicator Definitions, R17](#))

Apgar Score: is the distribution of APGAR score at 1 minute or at 5 minutes (0-10) for live births. ([Euro-Peristat Indicator Definitions, R2](#))

Fetal mortality rate⁴: is the number of fetal deaths at or after 22 completed weeks of gestation in a given year per 1000 live and stillbirths in the same year calculated by gestational age, birth weight and plurality. Fetal deaths are differentiated by whether they are spontaneous fetal deaths or result from a termination of pregnancy. ([Euro-Peristat Indicator Definitions, C1](#))

Neonatal mortality rate: is the number of neonatal deaths (day 0 through 27) after live birth in a given year per 1000 live births in the same year calculated by gestational age, birth weight and plurality. This rate is presented for all births at or after 22 completed weeks of gestation. This rate is sub-divided by timing of death into early neonatal deaths (0-6 days of life) and late neonatal deaths (7-27 days). ([Euro-Peristat Indicator Definitions, C2](#))

Infant mortality rate: is defined as the number of infant deaths (days 0-364) after live birth at or after 22 completed weeks of gestation in a given year, expressed per 1000 live births that same year. ([Euro-Peristat Indicator Definitions, C3](#))

⁴ In this report we do not present whether fetal deaths are spontaneous or result from a termination of pregnancy.

About this Report

This report presents Perinatal Health Indicators on the characteristics of childbearing women, the care of women and babies during pregnancy, and, babies' health, for the period 2007-2013. Data for live births and stillbirths were collected by the midwifery staff of the maternity units of all public hospitals in Cyprus. They were entered into an electronic database and analysed by the Health Monitoring Unit of the Ministry of Health.

Most of the indicators presented in this report are according to the definitions of the European Perinatal Health Report 2010 of the Europeristat (www.europeristat.com)

The reason that the number of births in this report differ from those published by the Statistical Service is the difference in the data source of each department, MOH and Statistical Service.

Summary Results

- Births in Public Sector as a percentage of total births in Cyprus have increased over the period 2007-2012, but they have fallen by 0.7% in year 2013 (table and graph 1).
- The absolute number of live births in Public Hospitals has risen steadily during the period 2007-2012, but it has fallen in year 2013 (table 2 and graph 2a).
- The number of twin births per 1000 women has increased by 5.3% in 2013, while the number of triplets has decreased by 2.4% (table and graph 3).
- The percentage of women with 2nd or higher order birth was higher than the one of women having their 1st child, for all years (table and graph 4).
- In year 2013, the percentage of women with age 35 or more that deliver triplets was higher, 50%, than the corresponding one for 2012, 33.3%. evenmore, in both years 2012 and 2013, the percentage of women with age 35 or more that deliver triplets was higher, than the one for twins or singles (table and graph 6b).

- From the year 2009 till 2012 the percentage of women from EU and other countries delivering babies in Cyprus Public Hospitals, has exceeded the corresponding percentage of Cypriot women. However, in 2013 this percentage has fallen and it was even less than the one of Cypriot women (table and graph 7b).
- The percentage of women who smoked during pregnancy shows an increase from 8.8% in 2007 to 14.3% in 2013 (table and graph 8).
- Most women begin antenatal care during the 1st trimester, with an average percentage during the years of about 60%. However, care begins in the 2nd or 3rd trimester for about 19% and 17%, respectively, of all women. The percentage of women with no antenatal care at all was about 3% (table and graph 13).
- On average, for the period 2007-2013, 2.3% of women giving birth in the Public Sector became pregnant after some form of assisted reproductive technique, with 1.9% in the vitro fertilization (IVF) (table and graph 14a). Pregnancies following fertility treatment are more likely to result in multiple pregnancies, in low birth weight pregnancies or in preterm births (tables and graphs 14b, 14c, 14d).
- There was a steady increase in the rate of caesarean sections in the Public Sector from 34.1% in 2007 to 45.4% in 2013 (table and graph 16a). Caesarean sections have much higher percentages in the case of twins and triplets than in the case of single babies (table and graph 16c). Among preterm births the percentage of caesareans was higher than among vaginal deliveries (table and graph 16d). In the Private Sector the percentage of caesareans from year 2012 to 2013, had a small increase, around 4%. On average, the percentage of caesareans is high for all periods, around 59% (table and graph 16e). Regarding the total births of all Cyprus the percentage of caesareans was also steady for all periods, around 53% (table and graph 16f). Regarding caesarean sections, the percentage of those occurred in the Private Sector was higher of the ones occurred in the Public Sector for all years, (68% and 32% respectively for the year 2013) (table and graph 16g).⁵
- On average, for the years 2007-2013, more than 50% of preterm live births (<37 weeks of gestation) admitted to neonatal intensive care unit (NICU) (table and graph 19b).
- On average, for the years 2007-2013, more than 90% of babies received some breast milk during the first 48 hours after birth. The rate of exclusive

⁵ Cyprus according to the data of European Perinatal Health Report 2010 had the highest overall caesarean rate, at 52.2%, followed by Italy with 38%. http://www.europeristat.com/images/doc/EPHR2010_w_disclaimer.pdf

breastfeeding in 2013 was 27.7% and the rate of mixed breastfeeding in the corresponding year 64.2%. The variance in the rates during the period 2007-2013 may be due to higher precision in data entry. The rate of not breastfed births has remained rather steady around 8.5% (table and graph 20a).

- The fetal death rate of pregnancies with gestational age less than 32 weeks has increased from 54% in 2007 to 75% in 2012 and to 74% in 2013 (table and graph 23a).

Twins and triplets are more likely to be borned as preterms (less than 37 weeks) with percentages of 100% and 82%, respectively, for the year 2012, and 100% and 88%, respectively, for the year 2013 (table and graph 23b).

- The fetal death rate with birthweight under 1500 grams increased from 62% in 2007 to 79% in 2013 (table and graph 24a).

Twins and triplets are more likely to be borned underweight (under 2500 grams) with percentages of 100% and 78%, respectively, for the year 2012 and 100% and 81%, respectively, for the year 2013 (table and graph 24b).

- The rates of birthweight and gestationa age for total births, have positive correlation, the more the less the gestational age the less the birthweight (table and graph 25).

- Apgar at 5 minutes with scores less than 7, for live births for the period 2007-2013, kept a low percentage of about 1.2% (table and graph 26).

- Fetal mortality rate at or after 22 completed weeks of gestation per 1000 live births and stillbirths for the year 2011 is 3.5, for the year 2012 is 4.1, and for the year 2013 is 4.5.

Infant mortality rate per 1000 live births has increased from 2.7 in 2011 to 3.4 in 2012, and decreased again in 2013 to 1.6 (table and graph 27).
