

Climate change in Cyprus: projections from regional climate model simulations

Panos Hadjinicolaou

National Workshop

“Building capacities to cope with health impacts of climate change”

Cyprus, 1st September, 2009

THE CYPRUS
INSTITUTE

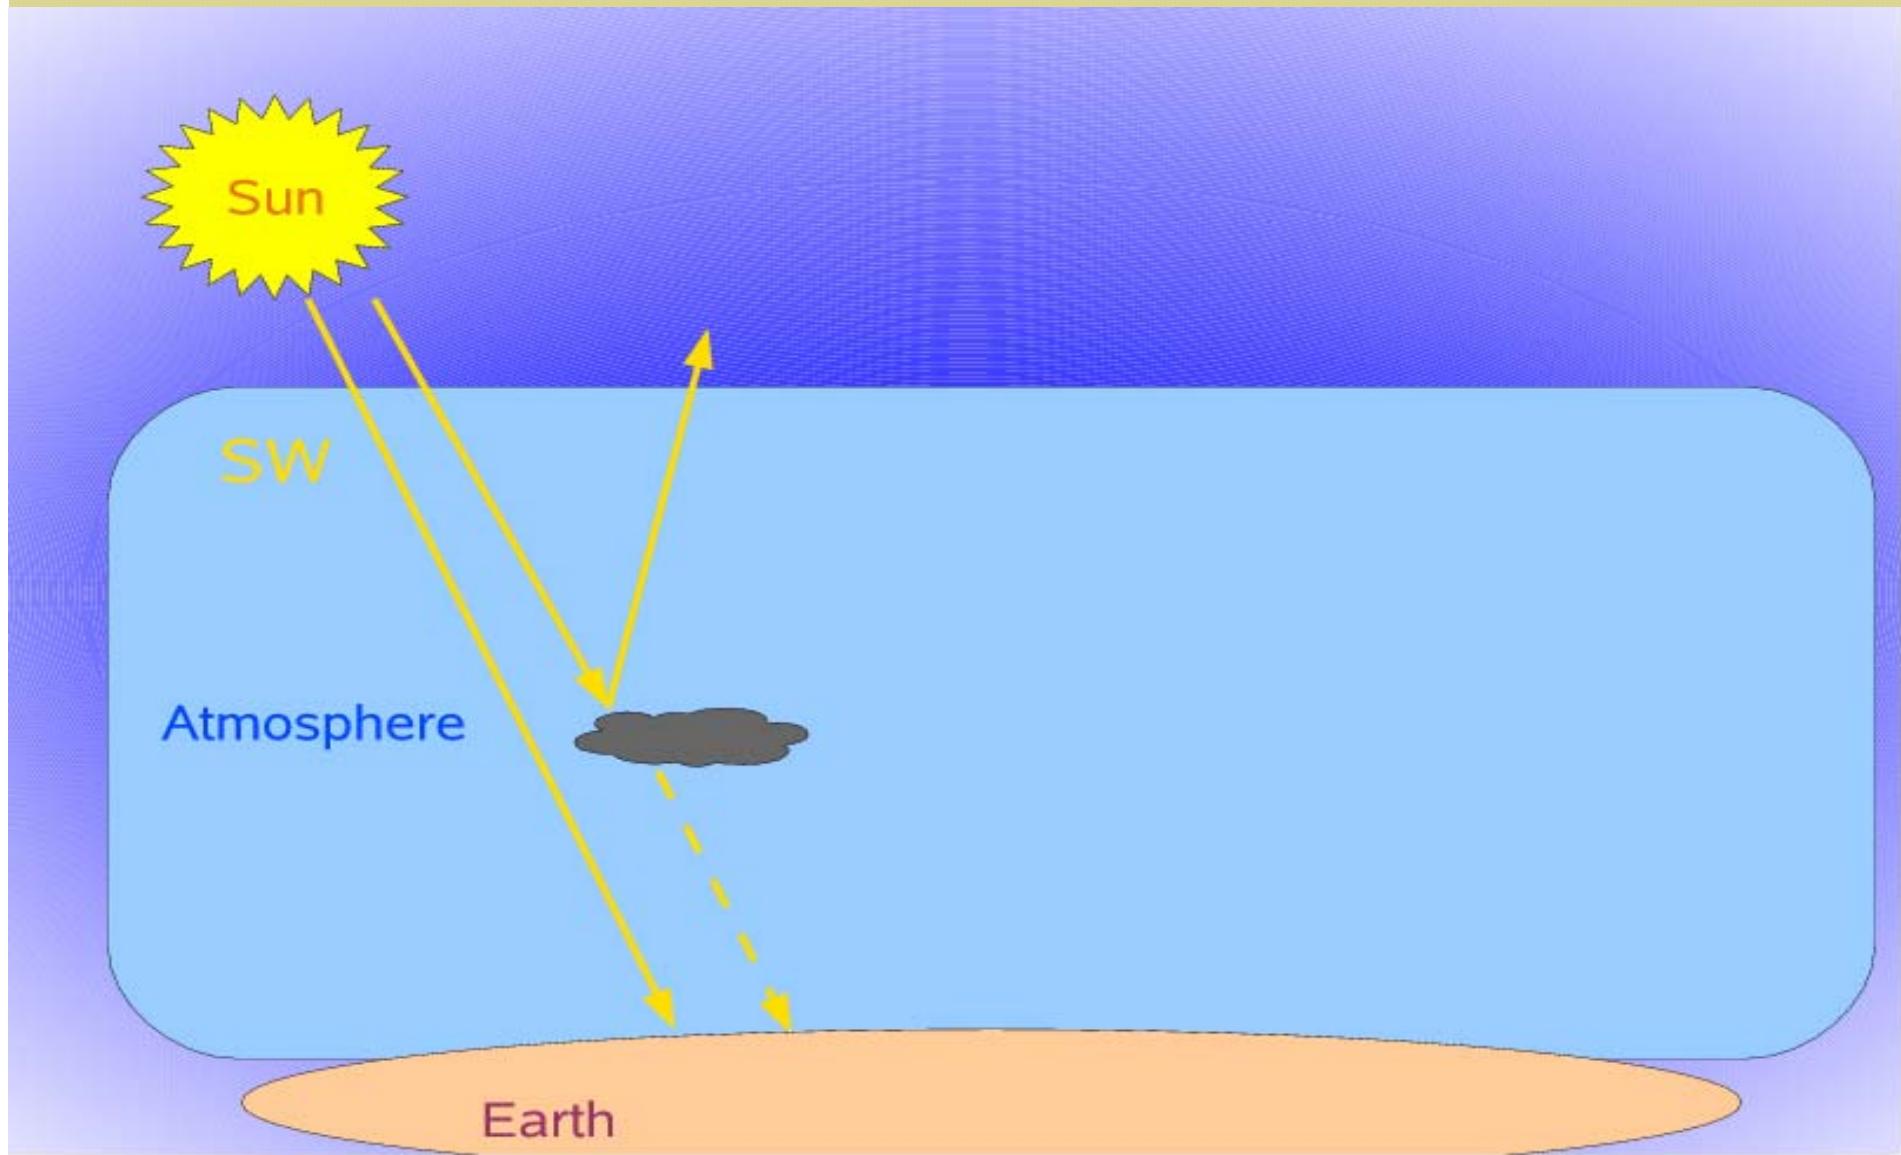

EEWRC

Outline

- Climate change basics
- Climate modelling
- Projections for Eastern Mediterranean
- Extremes over Cyprus
- Other atmospheric hazards linked to climate change
- Conclusions

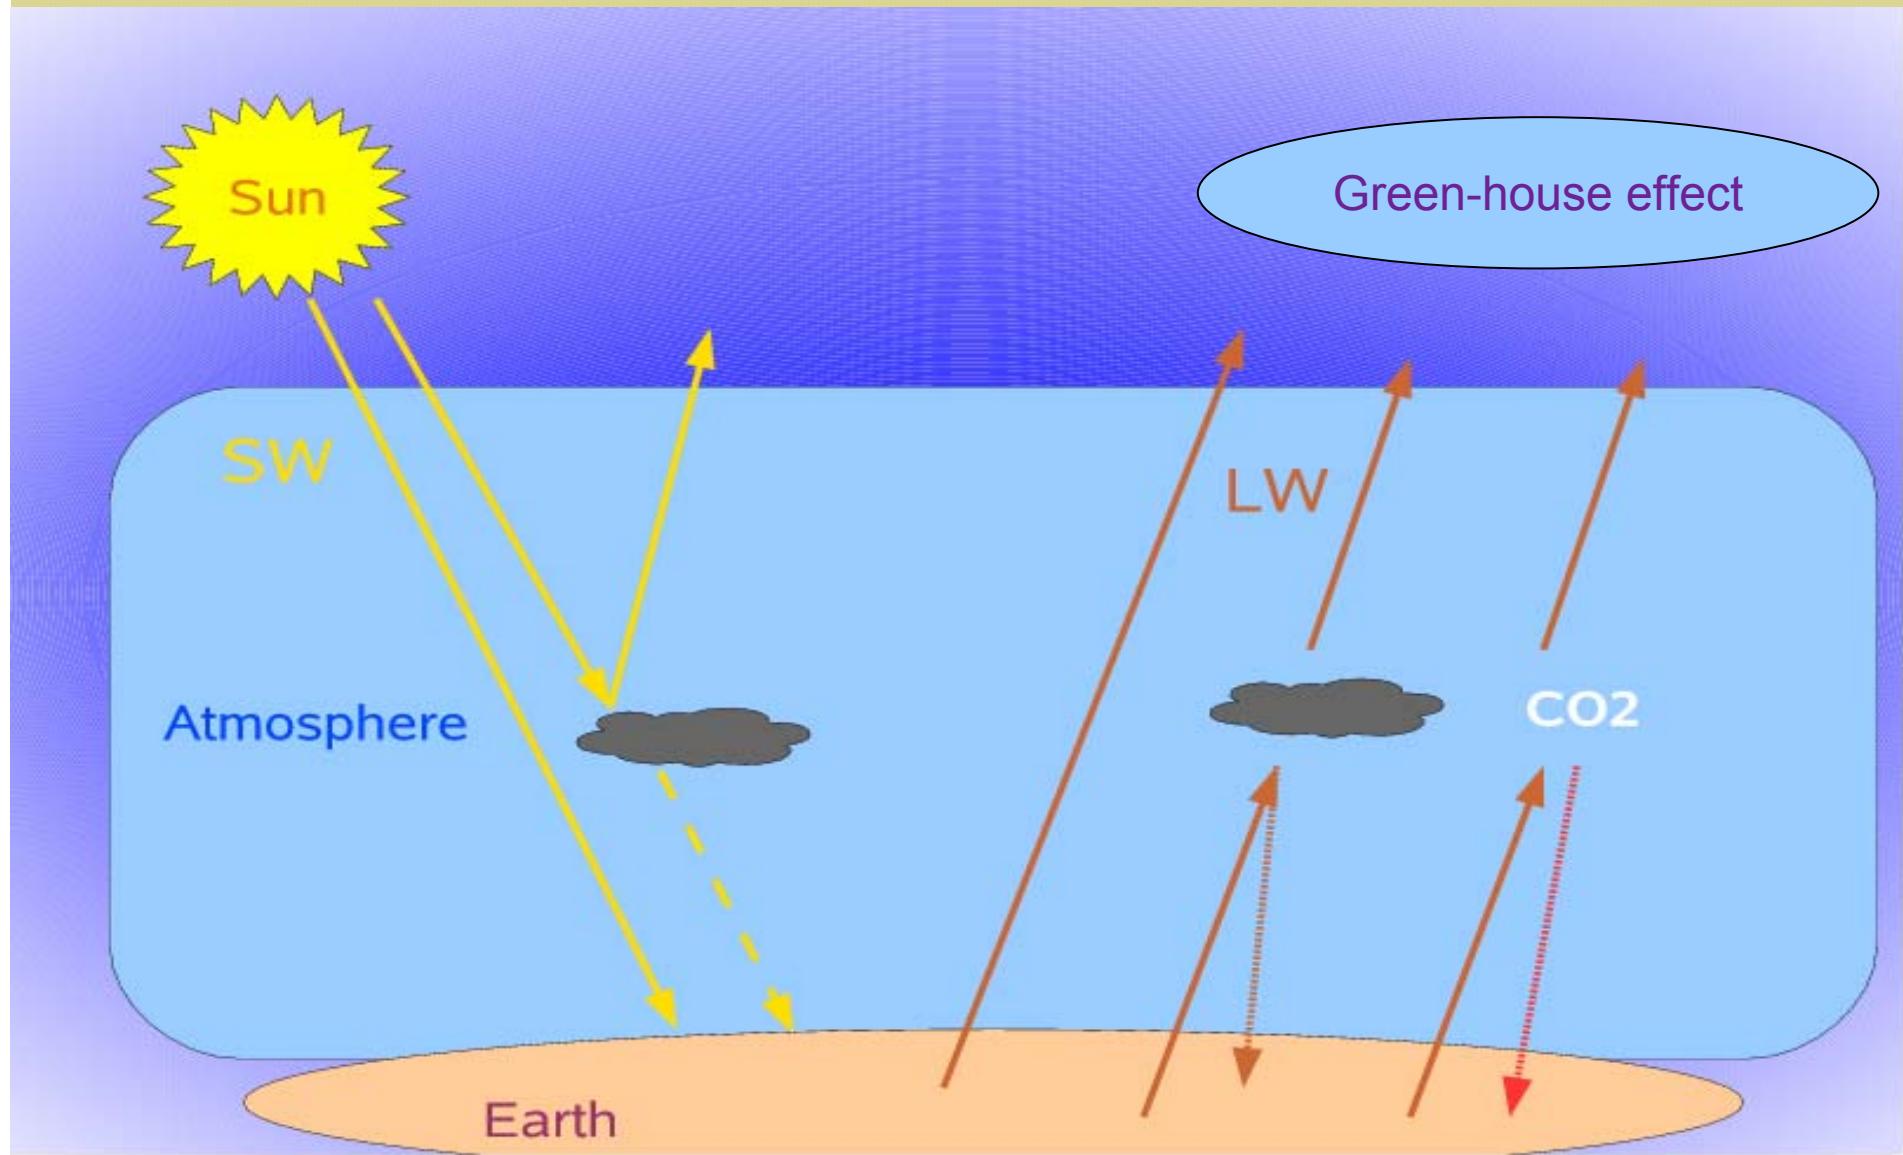

Energy balance:

Equilibrium

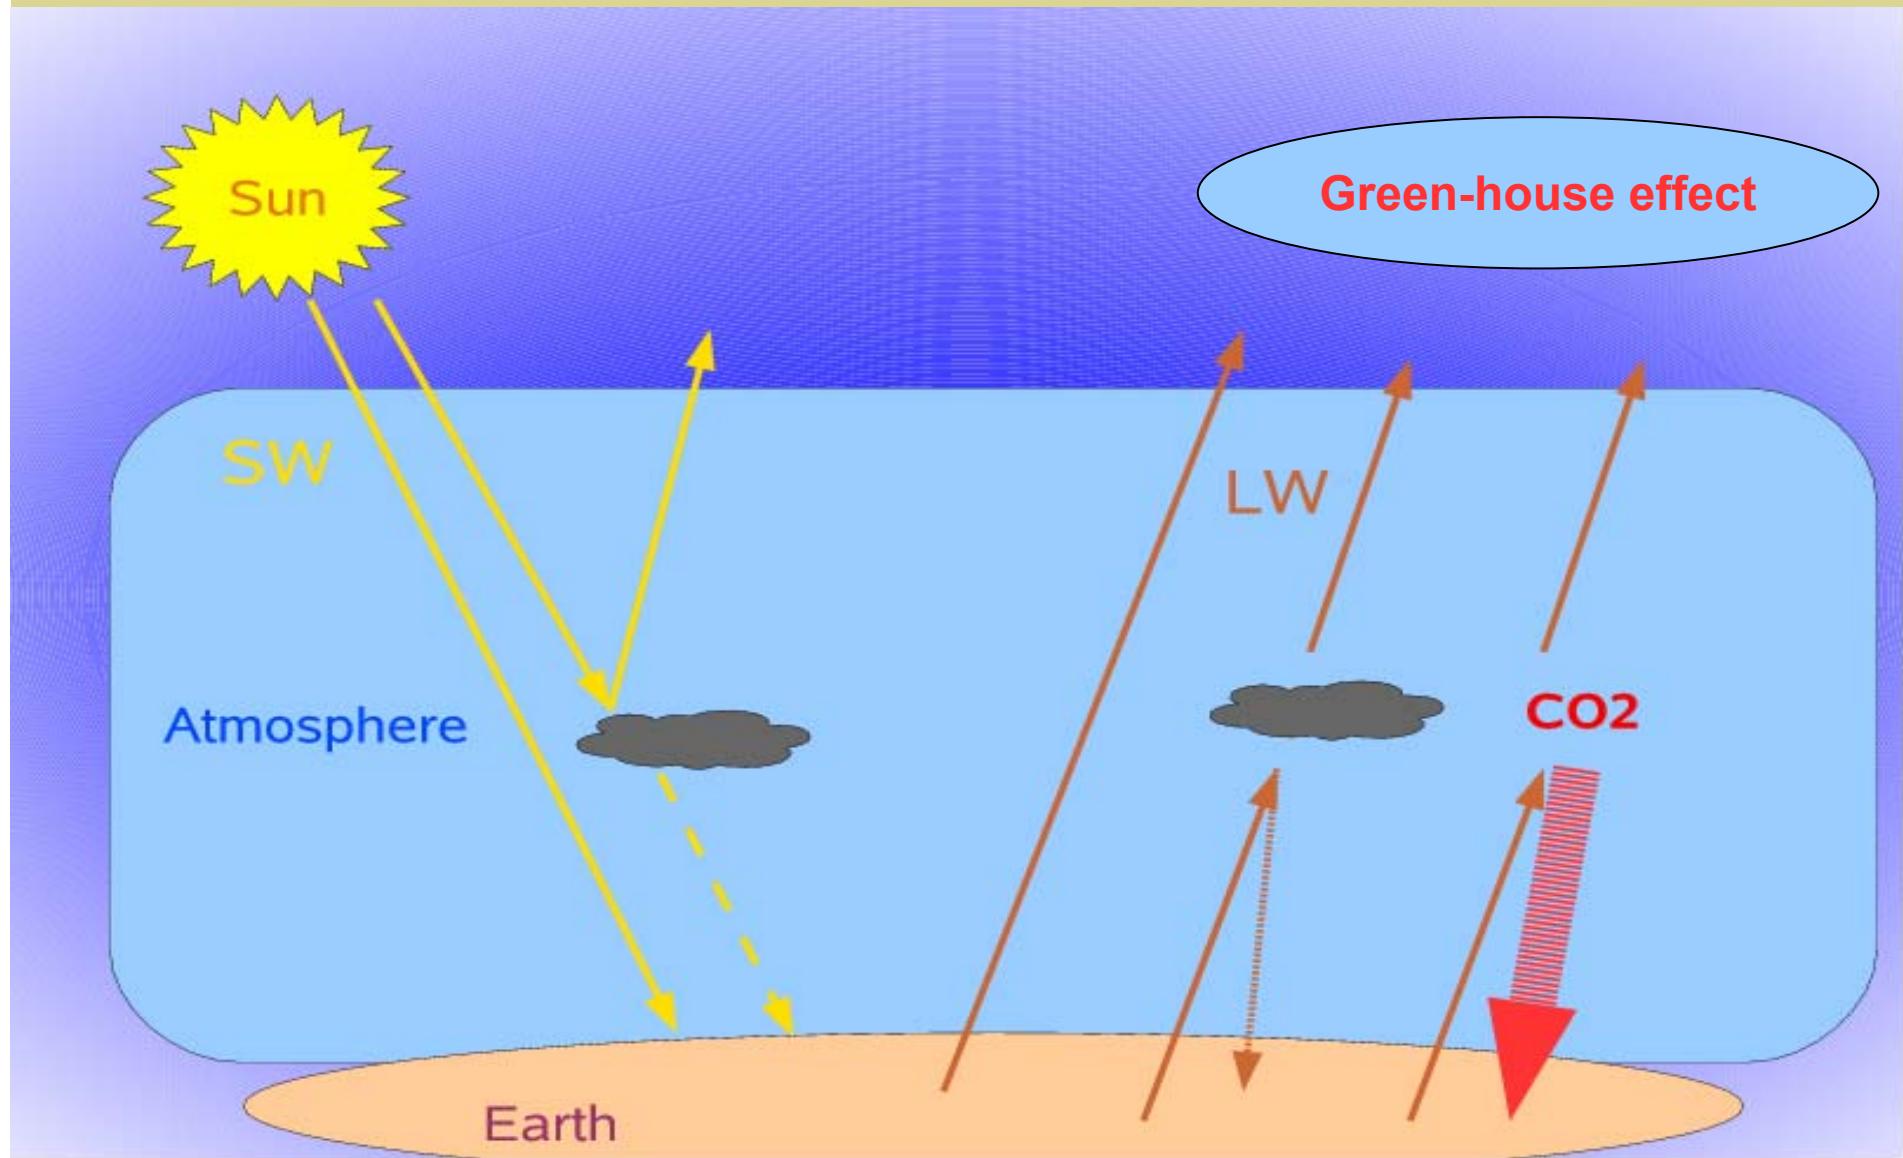

Energy balance:

CIMME project in Cyl

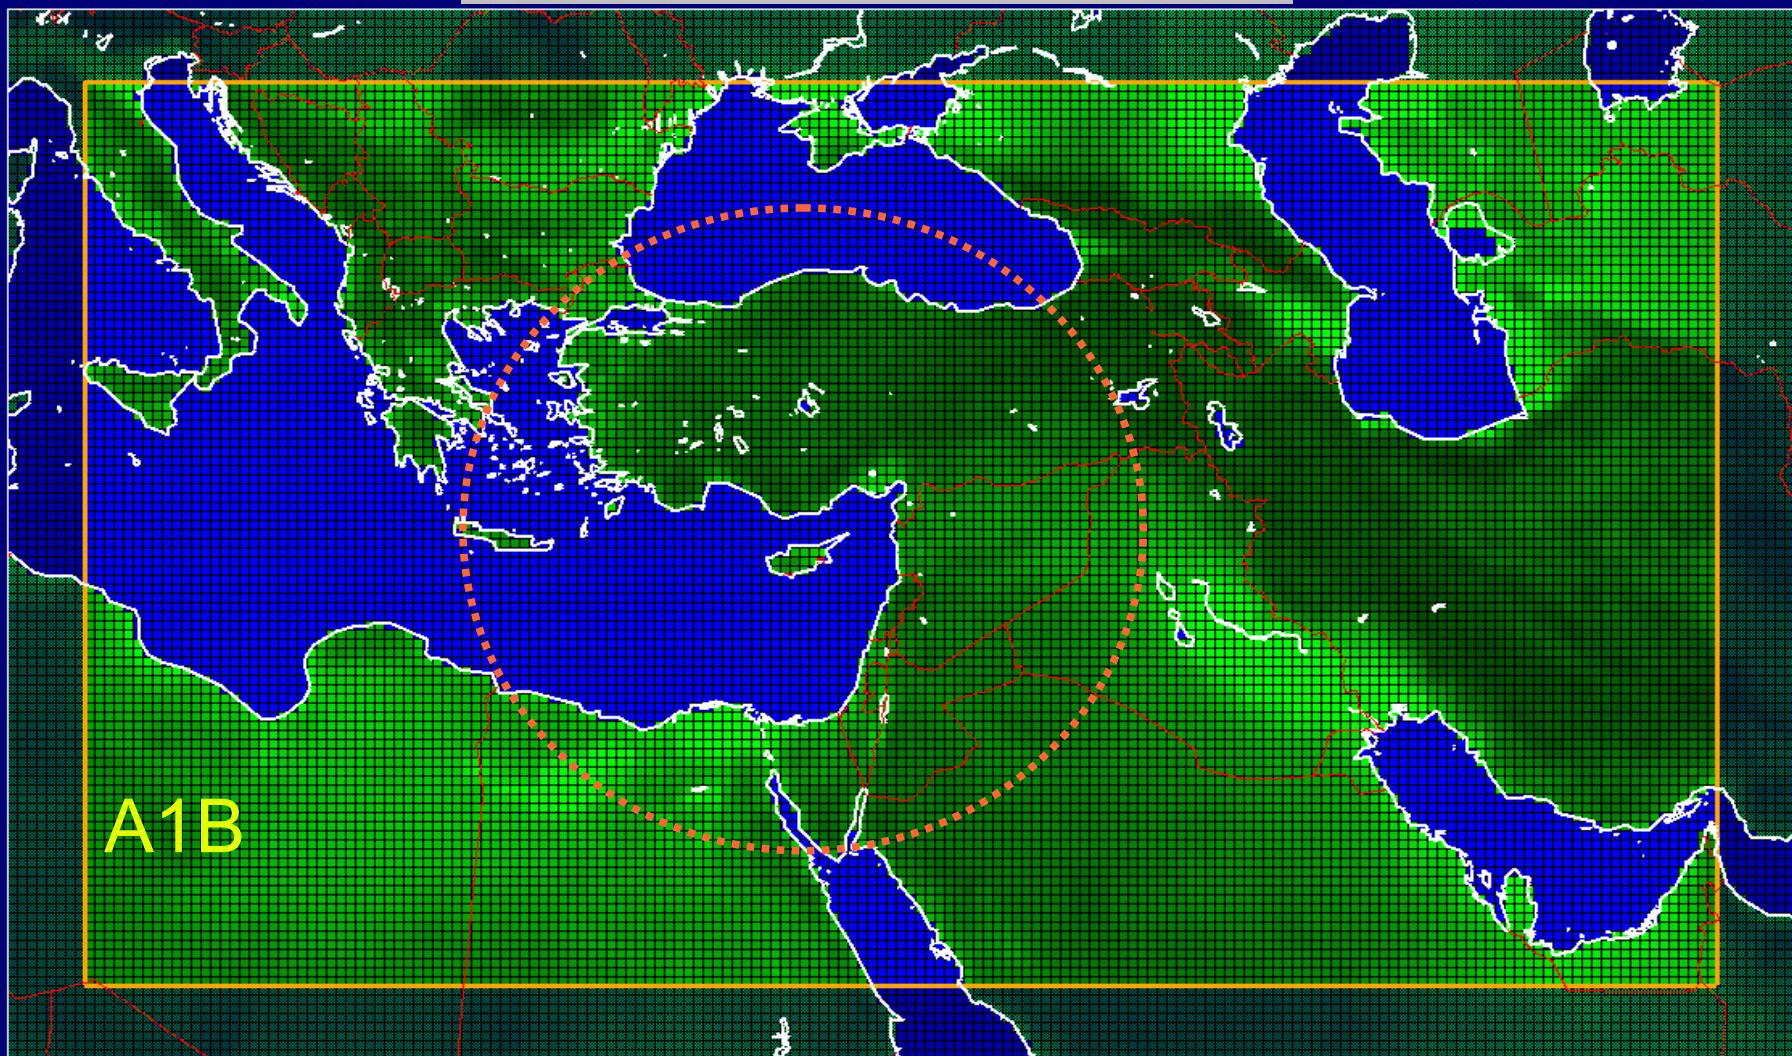

- Climate Change Impacts in the East. Mediterranean/Middle East
- Funded by Cyl
- International collaboration
- Cyprus, neighbouring countries and beyond
- Topical reports
- Leader: Prof. Jos Lelieveld, Coordinator: Dr Elena Xoplaki

CIMME Topical Reports

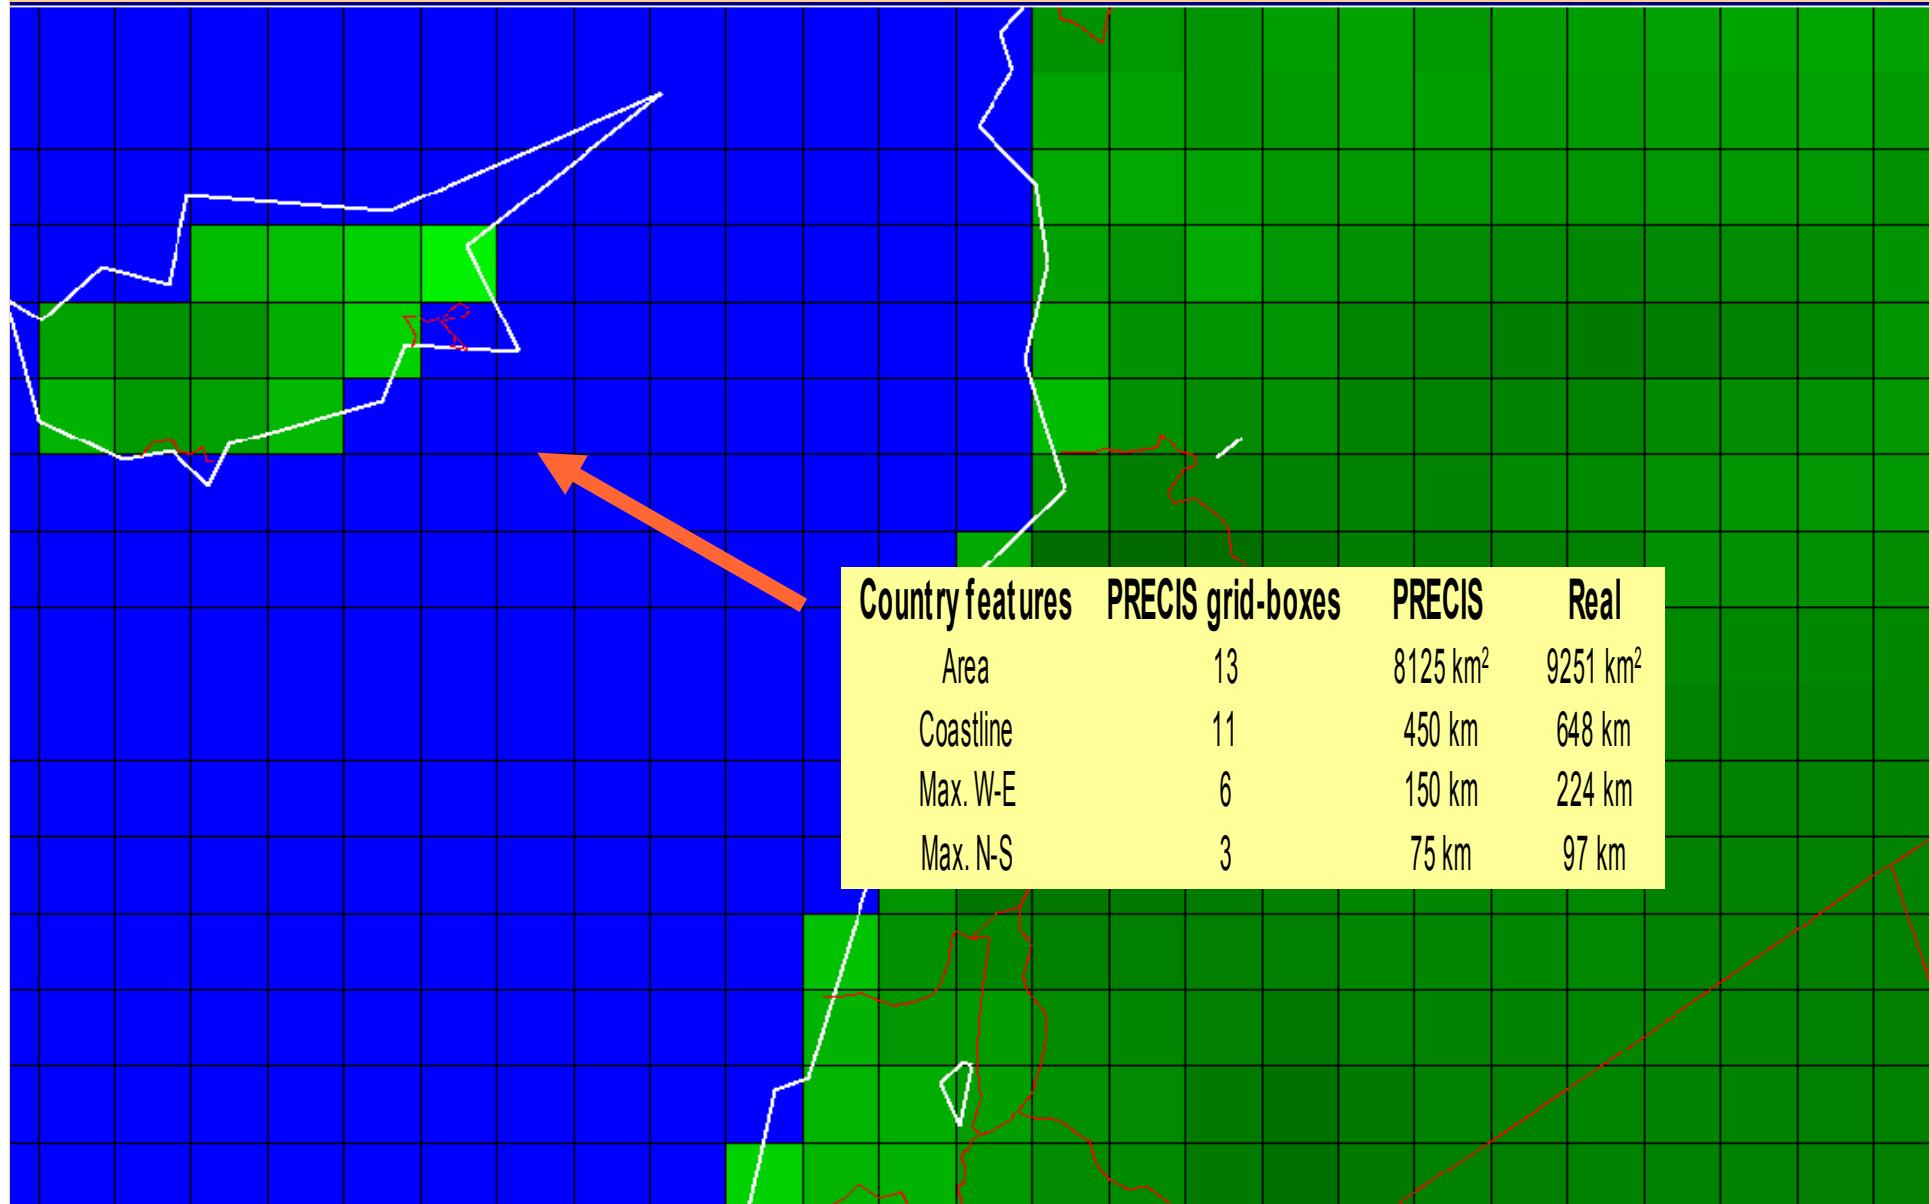

- Climate Assessment (Climate data collection, Climate projections-dynamical/statistical downscaling)
- Energy (Electricity demand, wind potential)
- Water (Regional water balances, weather modification)
- Air Quality (natural/anthropogenic effects)
- Health (Heat related mortality)

ENSEMBLES results for Cyprus

- National Observatory of Athens (Giannakopoulos, Zerefos)
- KNMI Netherlands, MPI Germany, Hadley Centre UK
- 6 locations in Cyprus
- Tmax, Tmin, Precip
- 1961-1990, 2071-2100
- Changes in mean climate, extremes

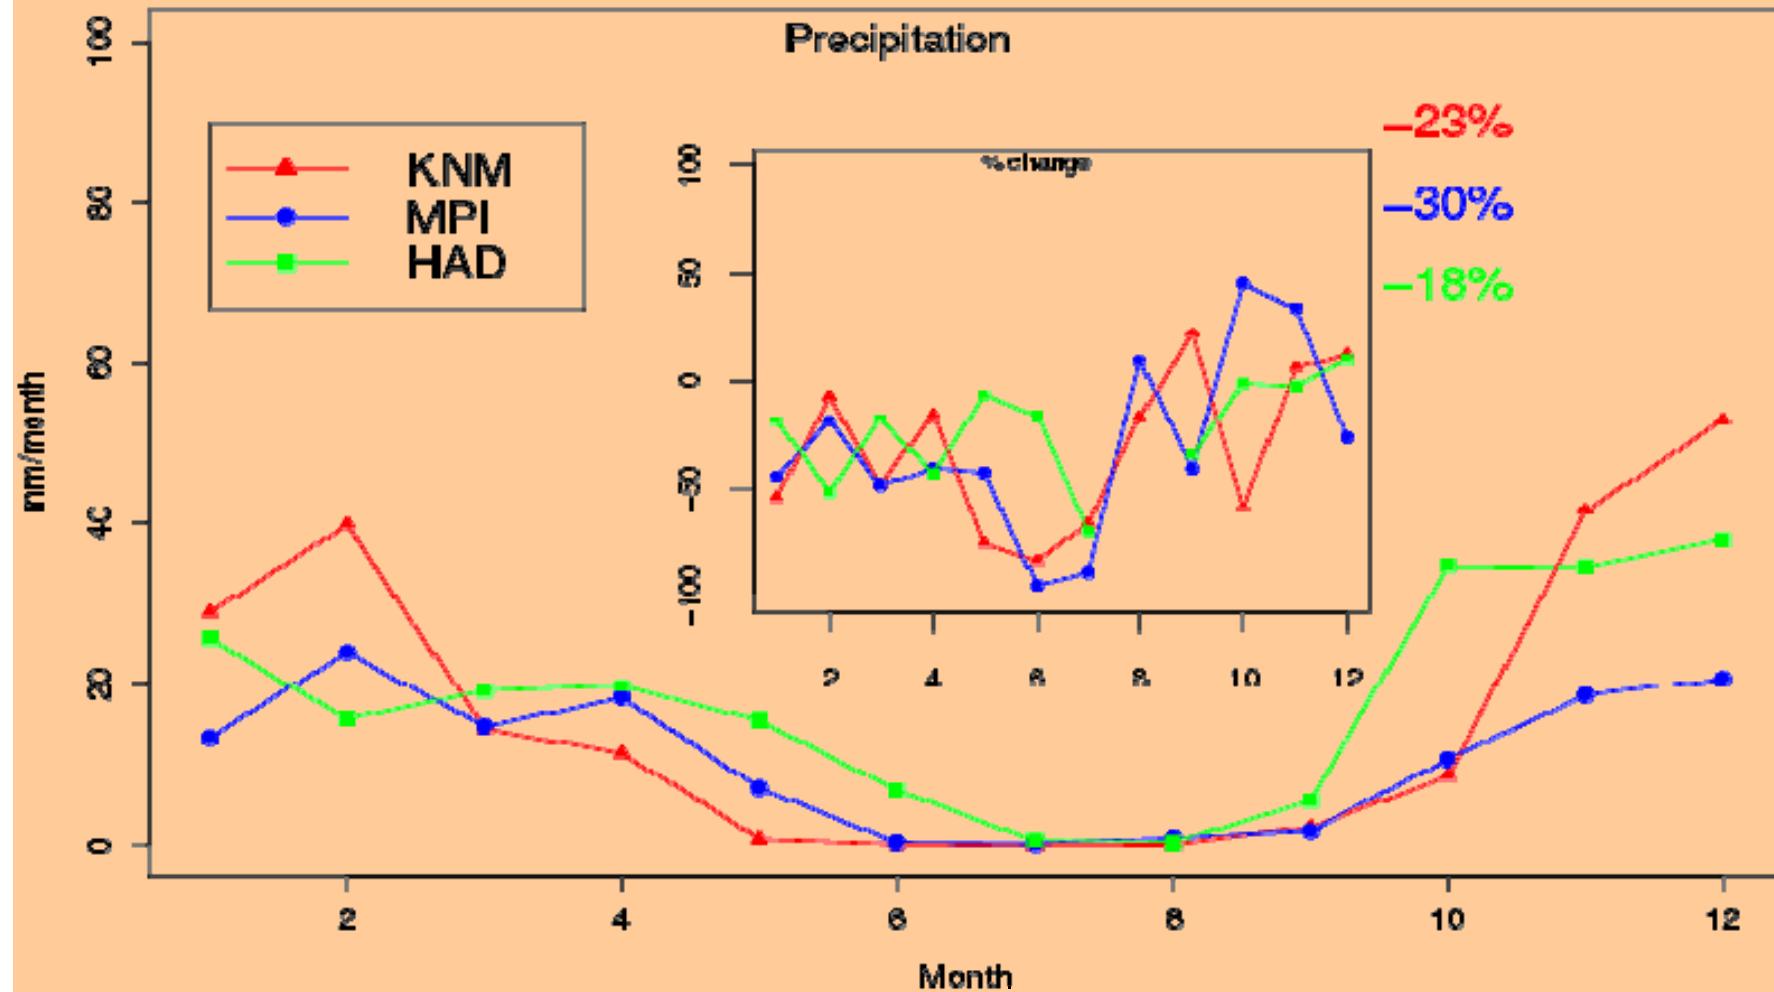

Mean climate: Nicosia

2071-2100

Mean climate: Nicosia

2071-2100

Indices of extremes: definition

Threshold:

Summer Days (SU35):

days with $T_{max} > 35^{\circ}\text{C}$

Tropical Nights (TR25):

days with $T_{min} > 25^{\circ}\text{C}$

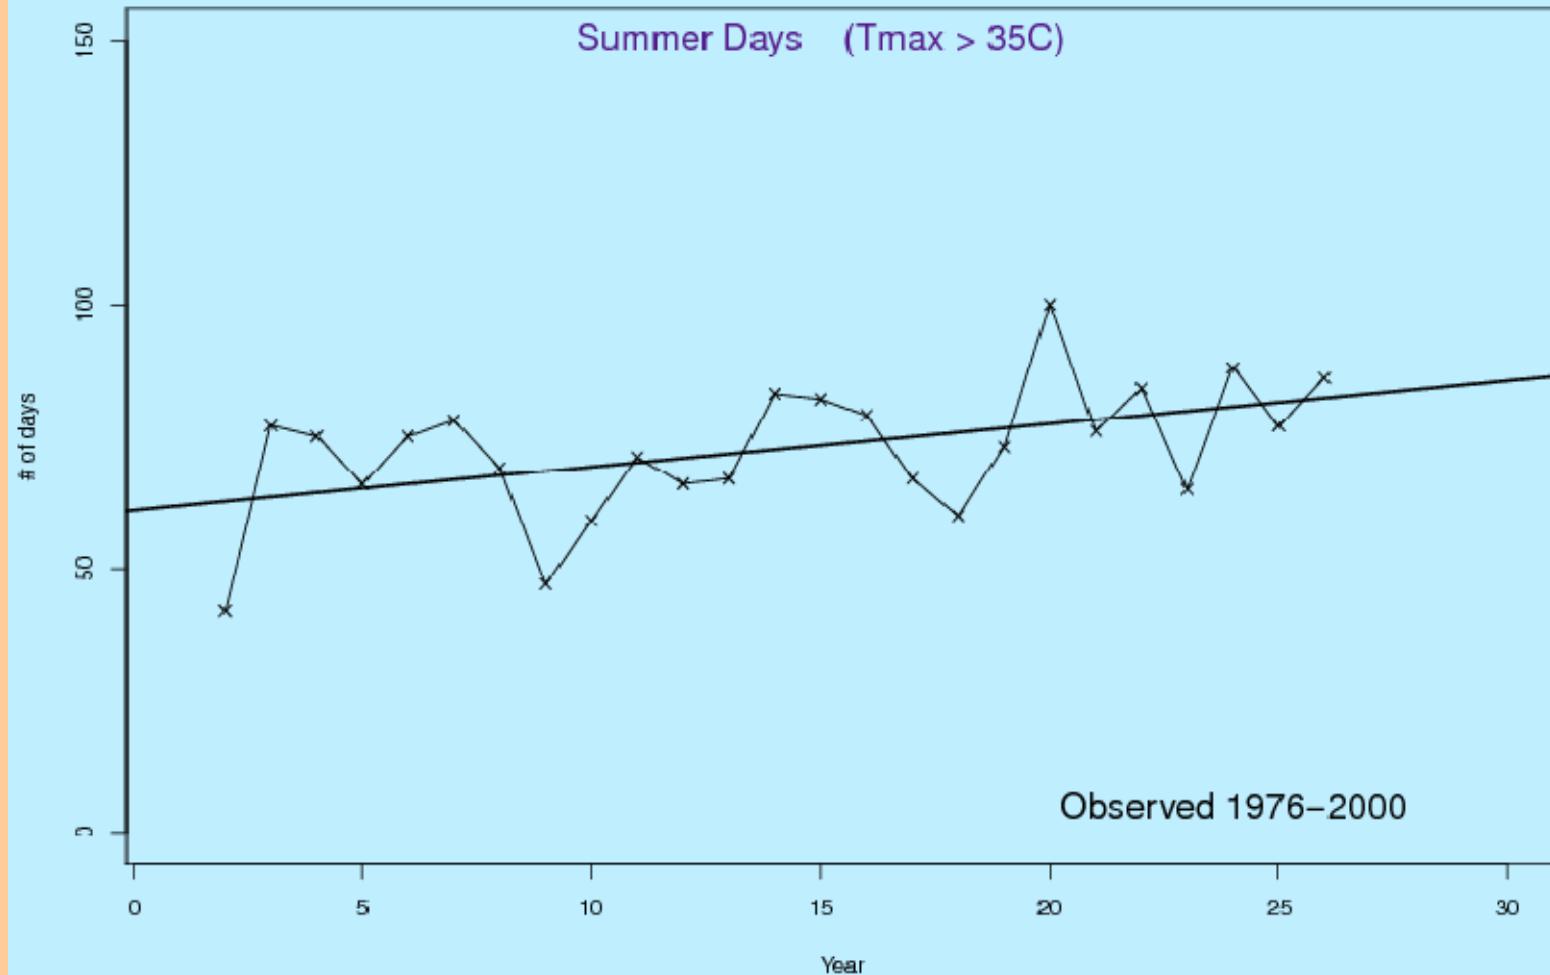

Duration:

Consecutive Dry Days (CDD):

consecutive days with Precipitation $< 1\text{mm}$

Index Name	UNITS	MSC 1976-200	RCM	RCM	Δ RCM
			1961-2000	2071-2100	
SU35 Summer days	Days	72±5	61	121	60
TR25 Tropical nights	Days	4±2	14	72	58
TXx Max Tmax	°C	42±0	42	47	5
TNx Max Tmin	°C	26±1	27	32	5
TXn Min Tmax	°C	9±1	8	11	3
TNn Min Tmin	°C	0±1	-1	3	3
DTR Diurnal temperature range	°C	13±0	12	12	0
CDD Consecutive dry days	Days	119±13	133	157	24
CWD Consecutive wet days	Days	5±0	5	4	-1
R10 Number of heavy precipitation days	Days	8±1	5	4	-1
R20 Number of very heavy precipitation days	Days	2±1	1	1	0
RX1 Max 1-day precipitation amount	Mm	42±7	20	29	9
RX5 Max 5-day precipitation amount	Mm	58±8	45	47	1
SDI Simple daily intensity index	Mm/day	7±0	5	5	0

Air quality and climate change

Ground-level Ozone

EU health protection limit = 57 ppbv

Permitted exceedances:
25 days averaged over 3 years

Summer average > 60 ppbv

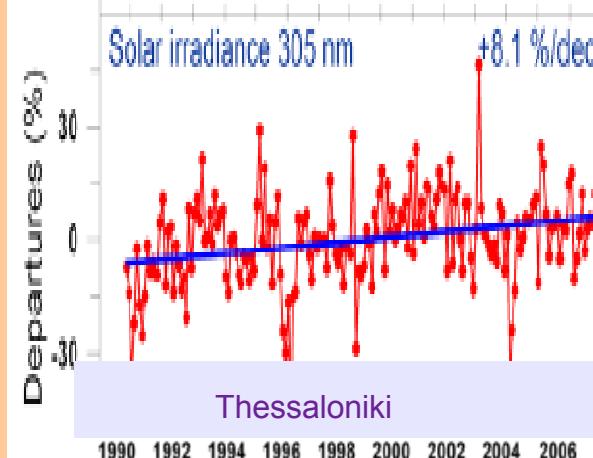

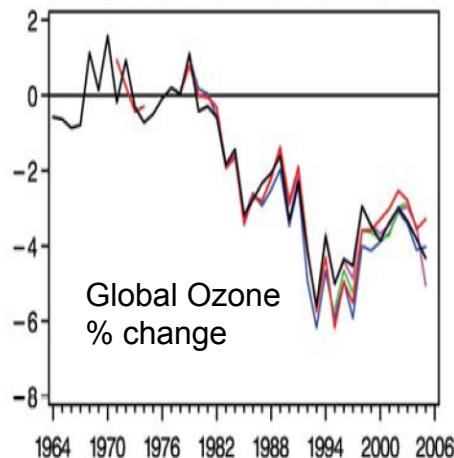

EMAC model, Lelieveld et al., *Atm. Chem. Phys.*, 2009

Atmospheric stability, dryness =>

lack of pollutant removal by convective mixing and precipitation

These dry and stagnant conditions are likely to increase under climate change that could deteriorate further the regional air quality

UV radiation and climate change

Stratospheric Ozone Depletion:

- caused by human activities
- enhanced UV radiation
- Climate change affects ozone through:
- stratospheric circulation
- stratospheric temperatures

Climate change can amplify several damaging effects of solar UV-B radiation on human health (Andrade et al., Photochem. Photobiol. Sci., 8, 2009)

- For the same UV dose, each 1°C increase in temperature would result in estimated increases in the incidences of certain skin cancers of 3%-6%,
- High temperatures and humidity, as experienced in the tropics, may increase the deleterious effects of UV-B radiation on human health, including suppression of immunity to infectious diseases and skin cancers

Epilogue

If concentrations of green-house gases continue to rise in the current rates, then by the end of this century global temperature will reach levels much higher than the ones human civilisation has been accustomed to in the last millennia

For Cyprus especially, regional climate models project:

Conclusions

- Average temperature will increase by 4°C
- Maximum temperatures will rise more in the summer than in the winter
- Summer days and tropical nights will increase by 2 months
- Precipitation will decrease by 30-40%
- Dry periods will increase by 1 month
- Air quality could deteriorate

Impacts of Mediterranean Climate Change on Human Health

Workshop
19-21 October 2009
Paphos Gardens Hotel, Cyprus

THE CYPRUS
INSTITUTE

EEWRC

Motivation

- **The Mediterranean Basin is experiencing impacts of climate change as its influence on human health**
- **The Mediterranean area has to deal with**
 - growing population pressure
 - vulnerability to impacts of climate change on human security
 - sea level rise
 - water supply and quality
 - drought
 - crop yields
 - direct impacts on human health – heat waves, wildfires, vector-borne diseases, etc.

Main Topics

- **Health effects of extreme heat and cold**
- **Vulnerability to extremes of the hydrologic cycle**
- **Exposure to infectious diseases**
- **Changes in aeroallergen and allergic airway diseases**
- **Air and water quality changes**
- **Climate change and the built environment**
- **Compounding effects of economic discrepancy and hardship on the health of Mediterranean populations in a changing climate**

Thank you

PRECIS vs CRU Precip 1980-1999

Cyprus Precipitation DJF

PRECIS: RCM model

www.precis.org.uk

Welcome to the PRECIS website!

PRECIS stands for "Providing REgional Climates for Impacts Studies."

Developed at the Hadley Centre at the UK Met Office, PRECIS is a regional climate modelling system designed to run on a Linux based PC.

PRECIS can be easily applied to any area of the globe to generate detailed climate change projections.

PRECIS: RCM model

PRECIS RCM: HadRM3P

Prognostic: P, u,v, T, q

Diagnostic: Precip., Cloud amount, Rad. Fluxes, evaporation rates, etc.

- Horizontal grid: regular Lat-Lon
- Coordinate system: spherical polar (rotated)
- Parametrisations: clouds/precipitation, radiation, aerosols (direct, 1st indirect effects), boundary layer, land surface (MOSES I), gravity wave drag

(Jones et al., 2004)

PRECIS: driving model

“Father” Model: HadCM3Q0

Coupled Ocean-Atmosphere

Initial and boundary (every 6h) conditions:

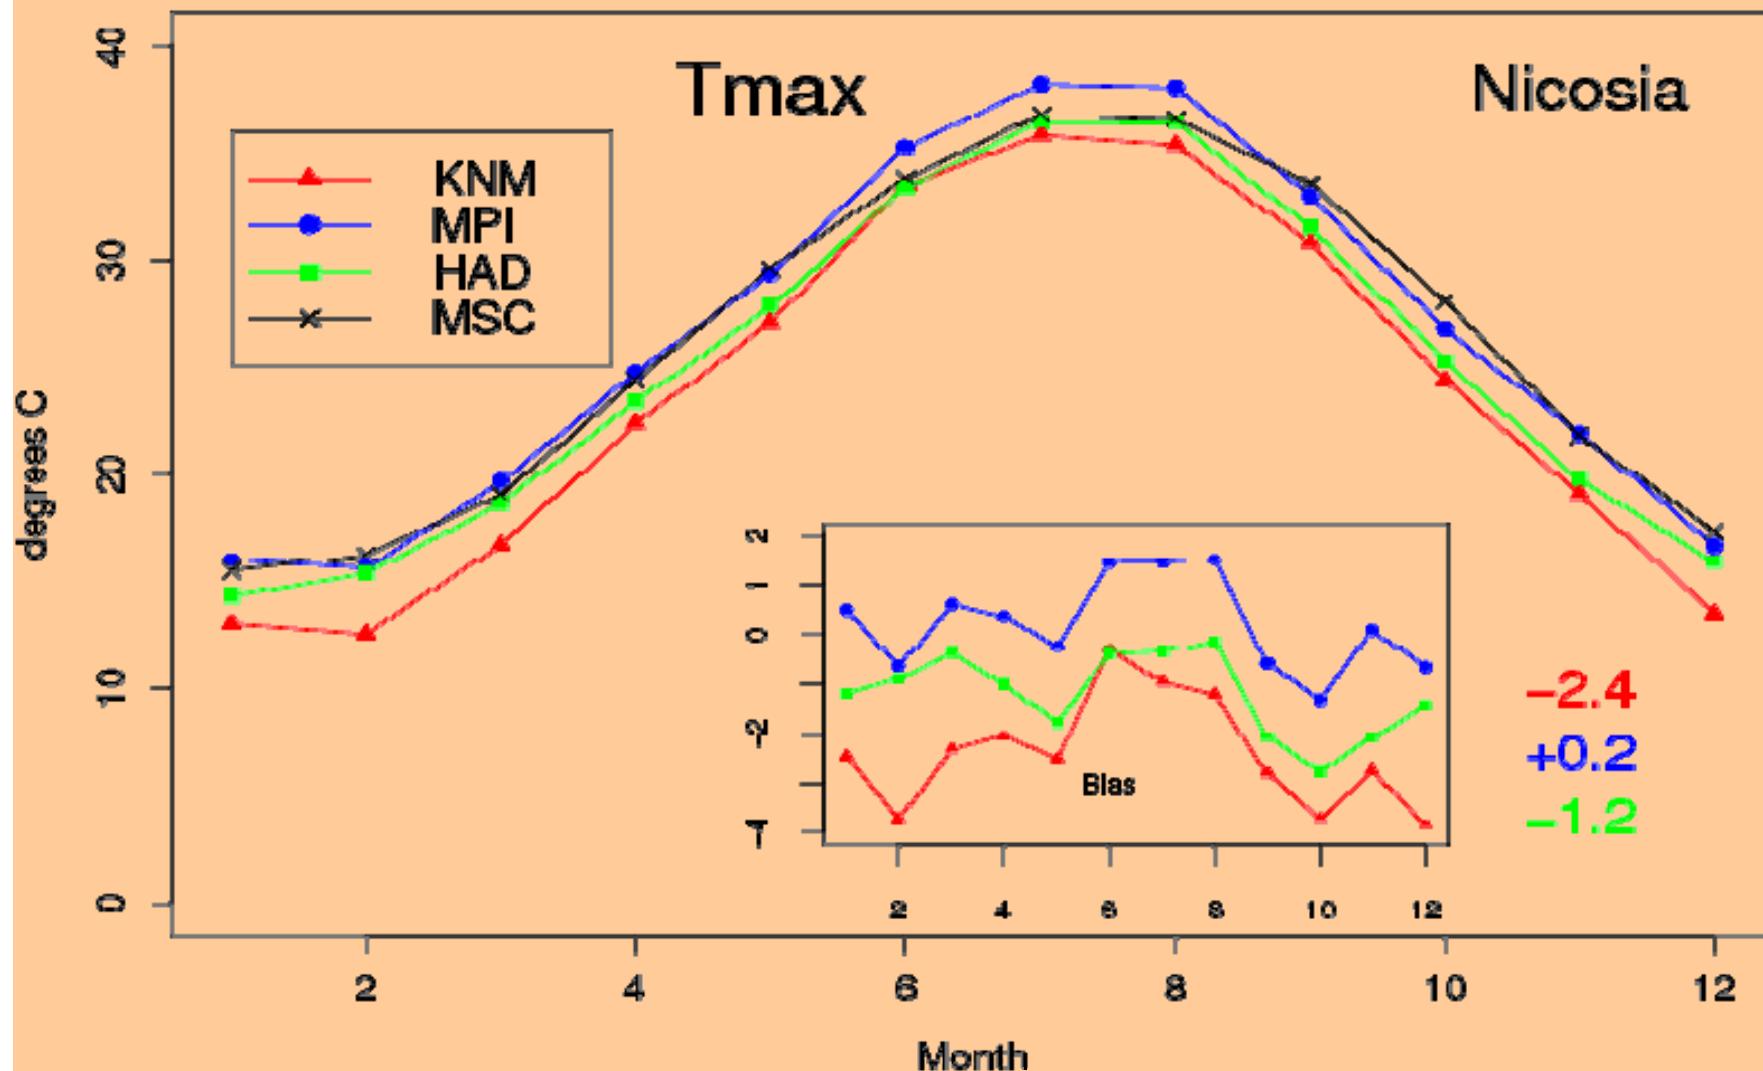

- atmosphere
- sea surface

Forcings/sensitivity

- SRES A1B emissions scenario (medium)
- normal climate sensitivity

Extremes: Cyprus

Acronym	Short Name	Definition	Units
TR25:	Tropical nights	= annual count when daily Minimum Temperature (T_N) > 25°C	days
SU35:	Summer days	= annual count when daily Maximum Temperature (T_x) > 35°C	days
DTR:	Diurnal temperature range	= monthly mean difference between T_x and T_N	°C
WSD:	Warm spell duration	= annual count of days with at least 6 consecutive days when $T_x > 90^{\text{th}}$ percentile	days
CSD:	Cold spell duration	= annual count of days with at least 6 consecutive days when $T_N < 10^{\text{th}}$ percentile	days
FD2:	Near-frost days	= annual count when $T_N < 2^{\circ}\text{C}$	days

Extremes: Cyprus

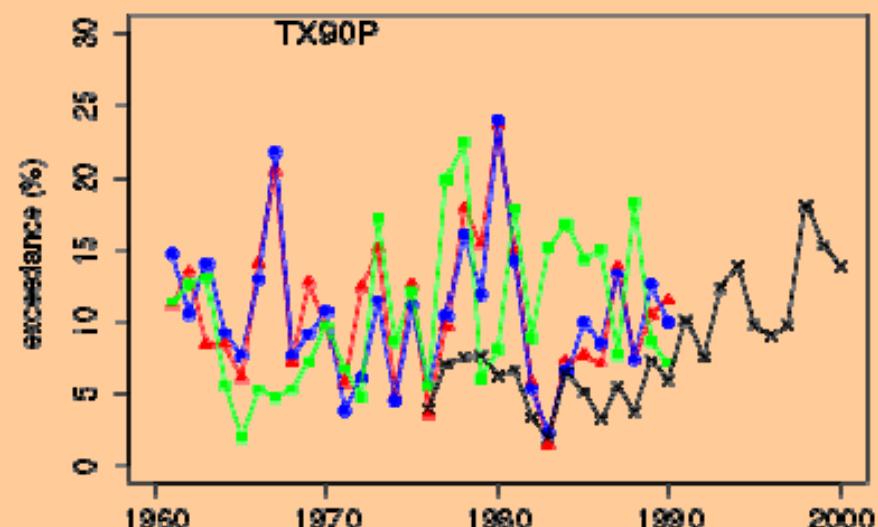

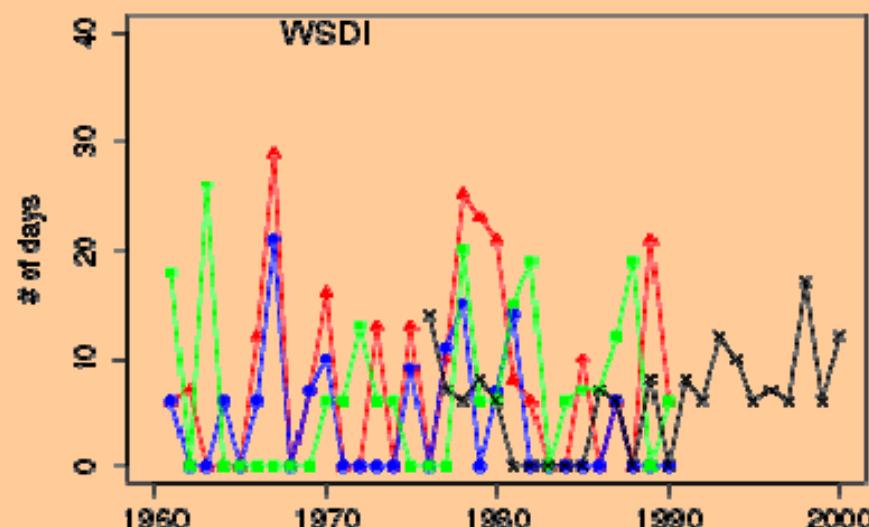

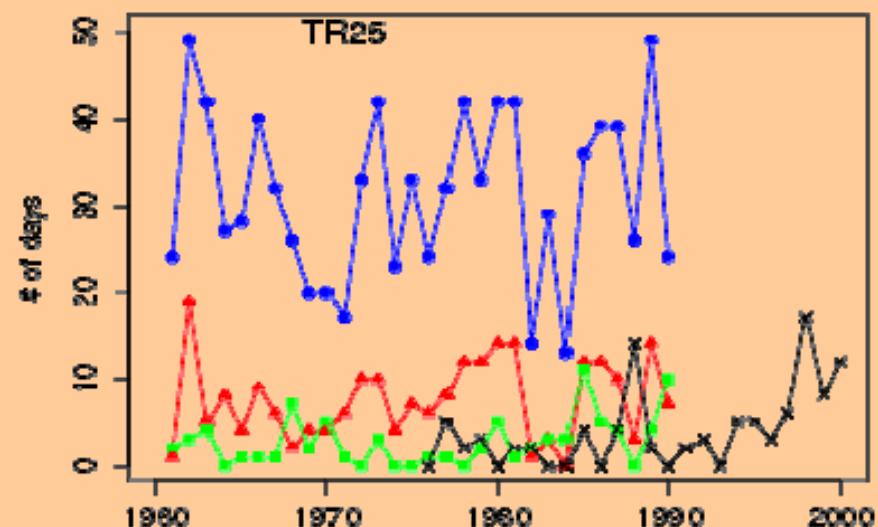

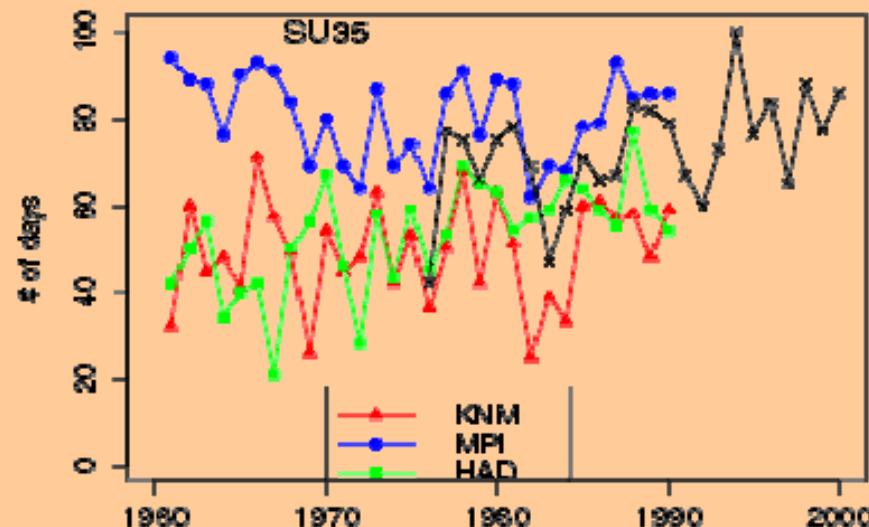

Acronym	Short Name	Definition	Units
TPR:	Annual total wet-day precipitation	= annual total precipitation in wet days (with rainfall $\geq 1\text{mm}$)	%
CDD:	Consecutive dry days	= maximum number of consecutive days with rainfall $< 1\text{mm}$	days
CWD:	Consecutive wet days	= maximum number of consecutive days with rainfall $\geq 1\text{mm}$	days
RX1:	Max. 1-day precipitation amount	= monthly maximum precipitation amount	mm
R95:	Very wet days	= annual total precipitation when rainfall $> 95^{\text{th}}$ percentile	mm
SDI:	Simple daily intensity	= annual total precipitation divided by the no. of wet days (rainfall $\geq 1\text{mm}$)	mm/day
